You can work with other supported programs on your computer, in addition to Photoshop Elements, such as other photo editors and other graphics software. You can also update the software to make it more compatible with other programs and the operating system. Adobe Photoshop Elements includes:

- Included Edges** The edge detection feature in Photoshop Elements can help to automatically improve your photos' edges. Elements uses the mathematical expressions of pixel colors to detect the edges of objects. It can work with digital photos in a variety of formats such as JPEG, TIFF, GIF, EPS and PDF. You can edit the existing edges, add new edges, or restore your image to a completely new state if it was lost. **Related Post: Photoshop in 18 easy steps**
- Noise Reduction** Elements can reduce noise to make your image clearer and sharper, even when you are working with a poor quality digital camera. Noise, which is small groups of pixels with similar color values, can make your image look hazy or blurry. Elements can improve the appearance of an image by removing noise. You can also choose the amount of noise reduction in your image.
- Eye Dropper** The Eye Dropper tool is part of Elements and enables you to copy values from different parts of an image, including edges, shadows and highlights. You can use the values to match color settings for certain parts of your image. You can copy an edge from the shadow areas of a picture and use it to create a tone-mapped photo to make bright colors look even brighter.
- Elements tools for editing images**
- Channels (Colors)** The Channels feature enables you to manually correct the white balance of your picture, as well as the color of certain areas, such as the sky, dark areas or the people's skin. Elements also has a Built-In function, which can automatically correct the color balance of a picture. You can also use the Adjustment Layers feature to change the color of areas that you want to make lighter or darker in your image. To use the Channels tool, go to Menu > Edit > Channels.
- Adjustment Layers** The Adjustment Layers feature enables you to add layers of adjustments to an image. For example, you can add two layers, one for the skin tones and one for the background and leaves, and then apply adjustments such as lightening or darkening.

Differential effects of the two metabotropic glutamate receptor subtypes on CA1 pyramidal neurons: a whole-cell current clamp study in the guinea pig hippocampal slice. To investigate whether one or both metabotropic glutamate receptor subtypes, mGluR1 and mGluR5, are involved in Ca²⁺ handling of hippocampal CA1 neurons, intracellular Ca²⁺ ([Ca²⁺]_i) changes were examined by means of fura 2 and whole-cell current clamp recordings in slice preparations from the guinea pig. Bath-applied mGluR1 agonists, (1S,3R)-1-aminocyclopentane-1,3-dicarboxylic acid (ACPD) and (S)-3,5-dihydroxyphenylglycine (DHPG), induced sustained increase of [Ca²⁺]_i through Ca²⁺ release from an internal store. On the other hand, mGluR5 agonist (1S,3R,4S)-1-amino-1,3-cyclopentane-4-sulfonic acid (1S,3R,4S)-ACPD, induced an increase of [Ca²⁺]_i through influx of Ca²⁺ from the extracellular space. To see the differential Ca²⁺ effects between the two receptor subtypes, CA1 neurons were also studied using whole-cell current clamp recording in the presence of 2 microM mGluR5-specific agonist. Bath application of 2 microM 2-methyl-6-phenylethynyl-oxycarbonyl-5-methyl-6,7,8,9-tetrahydro-5H-pyrido[3,2-b] [1,4]oxazin-4-one (2-methyl-2-(3-methylbenzyl)-3-sulfopropionyl)-amide (LY379268) (a preferential agonist of mGluR5) induced a membrane hyperpolarization and a sustained increase of [Ca²⁺]_i in a majority of neurons tested (52 of 76 cells, 67%) in a way similar to ACPD. ACPD- and DHPG-induced increase of [Ca²⁺]_i was inhibited by co-application of 2-methyl-2-(3-methylbenzyl)-3-sulfopropion
